

V5: HOPE

Impact indicator

Indicator Phrasing

INDICATOR PHRASING: Percentage of people in the project area that feel that the future will be better than the present

What is its purpose?

To assess the level of hope or positivity within the population as a way of assessing the possible trend. Do people feel that the situation is getting better or worse?

How to Collect and Analyse the Required Data

Collected as part of a survey. Possible questions could ask the extent to which respondents agree or disagree with the statement:

- 'I feel that my future will be better than my life is now'
- 'I think that the situation in my community will be better this time next year than it is now'
- 'I think that the situation in my country will be better this time next year than it is now'

For analysis a simple percentage should be taken of the number of respondents reporting that they agree or strongly agree with the statement. Care should be taken in deciding whether this percentage applies to just those surveyed or whether it can be ascribed to the population as a whole. This will depend on the design of the survey and whether it was a representative sample of the population.

Disaggregate by

Gender, age group and faith as standard. Depending on context and design the data could also be disaggregated by other relevant social identity markers.
